

ENERGYWISE

Your Guide to Energy-Efficient Lighting

GET THE FACTS

When comparing lighting products, look for the lighting facts label, which is required on most lighting packages by the U.S. Federal Trade Commission. The label provides accurate information on the brightness (in lumens), energy used, rated life and estimated annual energy cost of each product.

Since there are a variety of energy-efficient lighting products on the market, picking the right bulb can be a bit overwhelming. Use this guide to help find the right lighting products to fit your needs.

LEDS

- Use roughly 70 percent less energy than standard incandescent bulbs and last a minimum of 25,000 hours, or 22 years, based on average household use.
- ENERGY STAR®-rated LEDs are recommended for the greatest energy savings.
- Produce very little heat, cutting energy costs associated with home cooling as well as reducing fire hazards.
- Shatterproof, shock resistant and safe to touch.
- Come with a minimum three-year warranty.
- Some indoor models available with dimming.
- Some outdoor models available with automatic daylight shut-off or motion sensor.
